## Implementing Basic Data Structures in Java

### Arrays and Strings

Arrays are the simplest data structures, providing a fixed-size sequence of elements. Strings are sequences of characters stored as arrays of characters.

```
```java
```

```
// Example: Reversing a String using array
```

```
public String reverseString(String s) {
```

```
    char[] charArray = s.toCharArray();
```

```
    int left = 0, right = s.length() - 1;
```

```
    while (left
```

```
        char temp = charArray[left];
```

```
        charArray[left] = charArray[right];
```

```
        charArray[right] = temp;
```

```
        left++;
```

```
        right--;
```

```
    }
```

```
return new String(charArray);
```

```
}
```

```
...
```

## Linked Lists

Linked lists are dynamic data structures consisting of nodes, each containing data and a reference to the next node.

```
```java
```

```
class ListNode {
```

```
    int val;
```

```
    ListNode next;
```

```
    ListNode(int val) {
```

```
        this.val = val;
```

```
        this.next = null;
```

```
    }
```

```
}
```

```
// Example: Reversing a linked list
```

```
public ListNode reverseList(ListNode head) {
```

```
    ListNode prev = null;
```

```
    ListNode current = head;
```

```
    while (current != null) {
```

```
        ListNode nextNode = current.next;
```

```
current.next = prev;

prev = current;

current = nextNode;

}

return prev;

}

...

```

## Stacks and Queues

Stacks follow Last-In-First-Out (LIFO), while queues follow First-In-First-Out (FIFO).

```
```java

// Stack implementation using Java's built-in Stack class

import java.util.Stack;

public class StackExample {

    public static void main(String[] args) {

        Stack stack = new Stack();

        stack.push(10);

        stack.push(20);

        System.out.println("Top element: " + stack.peek()); // 20

        stack.pop();

        System.out.println("After pop: " + stack.peek()); // 10

    }
}

```

```
}  
  
...  
  
```java  
  
// Queue implementation using LinkedList  
  
import java.util.LinkedList;  
  
import java.util.Queue;  
  
public class QueueExample {  
  
    public static void main(String[] args) {  
  
        Queue queue = new LinkedList();  
  
        queue.offer("Apple");  
  
        queue.offer("Banana");  
  
        System.out.println("Front element: " + queue.peek()); // Apple  
  
        queue.poll();  
  
        System.out.println("After dequeue: " + queue.peek()); // Banana  
  
    }  
  
}  
  
...`
```

## Advanced Data Structures in Java

### Hash Tables / HashMaps

Hash maps provide constant-time average complexity for insertions, deletions, and lookups.

```
```java
```

```
import java.util.HashMap;

public class HashMapExample {

    public static void main(String[] args) {

        HashMap map = new HashMap();

        map.put("Apple", 3);

        map.put("Banana", 2);

        System.out.println("Quantity of Apple: " + map.get("Apple")); // 3

    }

}

```
```

## Heaps (Priority Queues)

Heaps are complete binary trees used for implementing priority queues efficiently.

```
```java

import java.util.PriorityQueue;

public class PriorityQueueExample {

    public static void main(String[] args) {

        PriorityQueue minHeap = new PriorityQueue();

        minHeap.offer(5);

        minHeap.offer(1);

        minHeap.offer(3);

        System.out.println("Minimum element: " + minHeap.peek()); // 1

    }

}

```
```

```
}
```

```
}
```

```
...
```

```
class TrieNode {
```

```
    TrieNode[] children = new TrieNode[26];
```

    boolean isEndOfWord;
```

```
}
```

```
public class Trie {
```

```
    private TrieNode root = new TrieNode();
```

```
    public void insert(String word) {
```

```
        TrieNode node = root;

            node = node.children[index];
```

```
        }
```

```
        node.isEndOfWord = true;
```

```
}

public boolean search(String word) {

    TrieNode node = root;

    for (char c : word.toCharArray()) {

        int index = c - 'a';

        if (node.children[index] == null)

            return false;

        node = node.children[index];

    }

    return node.isEndOfWord;
