 - High Temp + Long Time
- Data Collection:
 - Measure bond strength in each run.
- Analysis:
 - Use ANOVA to determine main effects and interaction.
 - Identify optimal conditions based on the highest bond strength.

Outcome:

- The analysis might reveal a significant interaction, indicating that the effect of temperature depends on the curing time.
- The solution guides selecting the best combination for maximum bond strength.

Solution Approach:

- Design:
 - Use a fractional factorial (e.g., 2^{4-1}) to reduce runs.
- Implementation:
 - Conduct experiments based on the design matrix.
- Analysis:
 - Determine significant factors via main effects and interaction effects.
- Result:
 - Focus on the key factors in subsequent detailed experiments.

Example 3: Response Surface Methodology (RSM) for Optimization

After identifying key factors, RSM helps find the optimal process settings.

Steps:

- Design:

- Use Central Composite Design (CCD) or Box-Behnken Design.

- Conduct Experiments:

- Vary factors systematically over a range.

- Model Fitting:

- Fit a quadratic model to the data.
