Cells are the smallest units of life, capable of performing all life processes. They form the basic building blocks of tissues and organs.

Types of Cells:

- Prokaryotic Cells: Simplest form, lack a nucleus (e.g., bacteria)
- Eukaryotic Cells: Possess a true nucleus and membrane-bound organelles (e.g., plant and animal cells)

Key components of plant and animal cells:

Component	Plant Cell	Animal Cell	Function
-----	-----	-----	-----
Cell Wall	Present (made of cellulose)	Absent	Provides shape and protection
Cell Membrane	Present	Present	Controls movement of substances in/out
Nucleus	Present	Present	Controls cell activities; contains genetic material
Cytoplasm	Present	Present	Site of metabolic activities
Chloroplasts	Present	Absent	Photosynthesis
Vacuoles	Large central vacuole	Small or absent	Storage, maintaining turgor pressure

Understanding Cell Functions:

- The cell membrane regulates transport via diffusion, osmosis, and active transport.
- The nucleus acts as the control center, housing DNA.
- Chloroplasts enable photosynthesis, converting sunlight into chemical energy.

Cell Cycle and Division

- Mitosis: A process of cell division resulting in two identical daughter cells, essential for growth and repair.
- Meiosis: Produces gametes with half the chromosome number, crucial for sexual reproduction.

Analytical note: Proper understanding of cell division mechanisms explains genetic inheritance and variation, key concepts in biology.

Life Processes: The Functions that Sustain Living Organisms

Life processes encompass the fundamental activities necessary for survival and reproduction.

Main life processes include:

- Nutrition
- Respiration

Nutrition in Plants and Animals

- Autotrophic Nutrition (Plants): Photosynthesis is the primary mode, involving chlorophyll, sunlight, water, and CO_2 to produce glucose and oxygen.
- Heterotrophic Nutrition (Animals): Ingestion, digestion, absorption, and assimilation of food.

Key points:

- Photosynthesis equation: $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{light energy} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
- Human digestive system involves mouth, esophagus, stomach, intestines, and accessory organs.

Respiration: The Energy Release

- Aerobic Respiration: Uses oxygen; produces maximum energy.
- Anaerobic Respiration: Occurs in oxygen-deprived conditions; produces less energy and lactic acid.

Equation for aerobic respiration:

Comparison: Understanding the biochemical basis of respiration explains energy management in organisms.

Transport Systems

- In Plants: Xylem transports water; Phloem transports food.
- In Humans: Circulatory system (heart, blood vessels) transports nutrients, oxygen, and waste.

Excretion and Removal of Waste

- In Humans: Kidneys filter blood, removing urea, excess salts, and water.
- In Plants: Waste products are expelled through stomata and lenticels.

Control and Coordination

- Nervous system (brain, spinal cord, nerves) and endocrine system (hormones) regulate body activities.
- The nervous system responds rapidly, while hormones have longer-lasting effects.

Photosynthesis and Respiratory Processes

Photosynthesis

A vital process in plants converting solar energy into chemical energy.

Factors affecting photosynthesis:

- Light intensity

Question What are the main functions of the plant cell wall? The plant cell wall provides structural support, protection, and helps maintain cell shape. It is primarily made of cellulose, hemicellulose, and lignin, and also aids in preventing excessive water intake. **How does photosynthesis occur in plants?** Photosynthesis occurs in the chloroplasts of plant cells, where sunlight, carbon dioxide, and water are converted into glucose and oxygen. The process involves light-dependent reactions and the Calvin cycle. **What is the difference between autotrophic and heterotrophic nutrition?** Autotrophic nutrition involves organisms synthesizing their own food using sunlight or inorganic substances (e.g., green plants), whereas heterotrophic nutrition involves obtaining food from other organisms (e.g., animals, fungi). **Why are enzymes important in biological processes?** Enzymes act as biological catalysts, speeding up chemical reactions in the body without being consumed. They are essential for processes like digestion, respiration, and DNA replication. **What is the role of the circulatory system in humans?** The circulatory system transports oxygen, nutrients, hormones, and waste products throughout the body. It also helps maintain temperature and pH balance, and defends against infections. **Explain the concept of genetic inheritance with an example.** Genetic inheritance is the transmission of traits from parents to offspring. For example, eye color is inherited through genes, where a child may inherit brown eyes from their parents who carry the dominant gene. **What are the main differences between DNA and RNA?** DNA is double-stranded, contains deoxyribose sugar, and stores genetic information. RNA is single-stranded, contains ribose sugar, and is involved in protein synthesis. **How do vaccines help in**

disease prevention? Vaccines stimulate the immune system to recognize and fight specific pathogens, providing immunity against diseases like measles, polio, and influenza without causing the disease itself.
