Statistics formulas are mathematical expressions used to describe, analyze, and interpret data. They quantify various aspects of data sets, such as their central location, spread, relationships, and significance. From simple calculations like mean and median to complex inferential tests like chi-square and t-tests, these formulas underpin much of statistical reasoning.

Basic Descriptive Statistics Formulas

Descriptive statistics provide a summary of the main features of a data set, offering insights into its distribution and variability.

- Measures of Central Tendency

These formulas describe the "center" of a data set.

Mean (Average)

Formula:

$$\bar{x} = \frac{\sum_{i=1}^n x_i}{n}$$

- (x_i) : each individual data point
- (n) : total number of data points

Application: Used to find the average value in a data set.

Median

- Arrange data in ascending order.
- If (n) is odd: median is the middle value:

$$\lfloor$$

$$\text{Median} = x_{\left(\frac{n+1}{2}\right)}$$

$$\rfloor$$

- If (n) is even: median is the average of the two middle values:

$$\lfloor$$

$$\text{Median} = \frac{x_{\left(\frac{n}{2}\right)} + x_{\left(\frac{n}{2} + 1\right)}}{2}$$

$$\rfloor$$

Application: Best for skewed distributions or ordinal data.

Question What is the formula for calculating the mean in statistics? The mean (average) is calculated by summing all data points and dividing by the number of data points: $\text{Mean} = (\text{Sum of all values}) / (\text{Number of values})$. How do you compute the median in a data set? To find the median, arrange the data in ascending order and identify the middle value. If there is an even number of observations, the median is the average of the two middle numbers. What is the formula for variance in a population? $\text{Variance} (s^2) = \frac{\sum (x_i - \mu)^2}{N}$, where μ is the population mean, x_i are data points, and N is the total number of data points. How is the standard deviation calculated from variance?

Standard deviation (σ) is the square root of the variance: $\sigma = \sqrt{\text{Variance}}$. What is the formula for the correlation coefficient (Pearson's r)? $r = \frac{[\sum (x_i - \bar{x})(y_i - \bar{y})]}{[\sum (x_i - \bar{x})^2 \sum (y_i - \bar{y})^2]^{1/2}}$, where $\bar{x}$ and $\bar{y}$ are the means of x and y datasets respectively. How do you calculate the probability of an event in statistics?
