Autonomic Nervous System Review Packet Answer Key

Understanding the autonomic nervous system (ANS) is essential for students and healthcare professionals alike, as it plays a vital role in regulating involuntary physiological functions. The *autonomic nervous system review packet answer key* provides comprehensive insights into the structure, function, and clinical relevance of the ANS. This guide aims to clarify key concepts, answer common questions, and reinforce learning through detailed explanations, making it an invaluable resource for mastering this complex system.

Overview of the Autonomic Nervous System

The autonomic nervous system is a subdivision of the peripheral nervous system responsible for controlling involuntary bodily functions. It operates largely below the level of consciousness, regulating heart rate, blood pressure, digestion, respiratory rate, pupillary response, and more.

Primary Components of the ANS

The ANS comprises two main divisions:

- **Sympathetic Nervous System** ? Prepares the body for "fight or flight" responses.
- **Parasympathetic Nervous System** ? Promotes "rest and digest" activities.

Some sources include a third component, the **enteric nervous system**, which primarily manages gastrointestinal functions independently but also interacts with sympathetic and parasympathetic systems.

Key Features of the ANS

- Operates involuntarily without conscious control.
- Uses a two-neuron chain: preganglionic and postganglionic neurons.
- Has widespread effects throughout the body due to extensive innervation.
- Maintains homeostasis by adjusting organ functions based on internal and external stimuli.

Structural Anatomy of the Autonomic Nervous System

Understanding the anatomical pathways of the ANS is crucial for grasping its functional roles.

Preganglionic and Postganglionic Neurons

The ANS's two-neuron chain involves:

- **Preganglionic neurons:** originate in the central nervous system (brainstem or spinal cord) and send fibers to autonomic ganglia.
- **Postganglionic neurons:** extend from ganglia to target organs.

Pathways of the Sympathetic Nervous System

- Originates in the thoracolumbar spinal cord segments (T1-L2).
- Preganglionic fibers are short and synapse in sympathetic ganglia located near the spinal cord (paravertebral ganglia) or along the abdominal aorta (prevertebral ganglia).
- Postganglionic fibers are generally long and extend to target organs.

Pathways of the Parasympathetic Nervous System

- Originates from the brainstem (cranial nerves III, VII, IX, X) and sacral spinal cord (S2-S4).
- Preganglionic fibers are long and synapse in ganglia located near or within target organs.
- Postganglionic fibers are short, directly influencing organ function.

Neurotransmitters and Receptors in the ANS

The efficiency of the ANS depends on specific neurotransmitters and receptor types that mediate responses.

Neurotransmitters

- **Acetylcholine (ACh):** Used by preganglionic neurons in both divisions and by parasympathetic postganglionic neurons.
- **Norepinephrine (NE):** Primarily used by sympathetic postganglionic neurons.
- Some sympathetic fibers (e.g., sweat glands) release ACh instead of NE.

Receptor Types

- **Nicotinic receptors:** Respond to ACh, found on postganglionic neurons and adrenal medulla.
- **Muscarinic receptors:** Respond to ACh, located on parasympathetic target organs.
- **Adrenergic receptors:** Respond to NE or epinephrine; include alpha (?) and beta (?) subtypes.

Functions of the Sympathetic and Parasympathetic Divisions

Each division of the ANS has distinct effects on various organs, often working in opposition to maintain balance.

Sympathetic Nervous System Functions

- Increases heart rate and force of contraction.
- Dilates bronchi to improve airflow.
- Constricts blood vessels in the skin and gastrointestinal tract, redirecting blood flow.
- Stimulates the release of glucose from the liver for energy.
- Inhibits digestion and urinary functions.
- Releases adrenaline and noradrenaline from the adrenal medulla.

Parasympathetic Nervous System Functions

- Decreases heart rate and contractility.
- Constricts bronchi.
- Stimulates digestion by increasing secretions and motility.
- Promotes urination and defecation.
- Constricts pupils and stimulates lacrimal and salivary glands.

Autonomic Reflexes and Responses

The ANS mediates numerous reflexes vital for maintaining internal stability.

Common Autonomic Reflexes

- **Baroreceptor reflex:** Regulates blood pressure via adjustments in heart rate and vessel tone.
- **Pupillary light reflex:** Controls pupil size in response to light.
- **Gastrointestinal reflexes:** Regulate digestion, motility, and secretion.

- Bladder reflexes: Coordinate urination and defecation.

Clinical Significance of Reflexes

- Abnormal reflex responses can indicate neurological or cardiovascular issues.
- Examples include orthostatic hypotension and autonomic neuropathy.

Common Disorders Related to the Autonomic Nervous System

Understanding common disorders helps contextualize the importance of the ANS and the significance of accurate diagnosis.

Autonomic Neuropathy

- Often associated with diabetes mellitus.
- Symptoms include orthostatic hypotension, gastroparesis, urinary retention, and erectile dysfunction.

Postural Orthostatic Tachycardia Syndrome (POTS)

- Characterized by excessive heart rate increase upon standing.
- Causes include dysregulation of the sympathetic nervous system.

Horner's Syndrome

- Results from disruption of sympathetic pathways to the face and eye.
- Symptoms include ptosis, miosis, anhidrosis, and enophthalmos.

Vasovagal Syncope

- Due to sudden parasympathetic activation leading to bradycardia and vasodilation.
- Causes fainting episodes triggered by stress, pain, or prolonged standing.
