Introduction to DNS and Wireshark

What is DNS?

DNS, or Domain Name System, is the backbone of the internet's naming infrastructure. It translates human-readable domain names (like `www.example.com`) into IP addresses that computers use to identify each other on the network. DNS operates through a hierarchical system of servers, including root servers, TLD servers, and authoritative name servers.

Role of Wireshark in DNS Analysis

Wireshark captures network traffic and provides a detailed view of transmitted packets. When analyzing DNS, Wireshark enables users to:

- View DNS query and response packets
- Identify DNS resolution issues
- Detect malicious DNS activity
- Troubleshoot network latency related to DNS

Setting Up Wireshark for DNS Analysis

Prerequisites

Before beginning your DNS analysis lab, ensure you have:

- Installed the latest version of Wireshark
- Administrative privileges on your machine
- A network environment where DNS traffic occurs naturally
- Basic knowledge of network protocols

Capturing DNS Traffic

To effectively analyze DNS traffic:

- Open Wireshark and select the appropriate network interface (Ethernet, Wi-Fi, etc.).
- Apply a capture filter to focus solely on DNS traffic: `udp port 53 or tcp port 53`.
- Start the capture and perform DNS-related activities, such as browsing websites or pinging domain names.
- Stop the capture once sufficient data is collected for analysis.

Analyzing DNS Packets in Wireshark

Understanding DNS Packet Structure

DNS packets consist of a header and question/answer sections. Key fields include:

- Transaction ID: Unique identifier for the query
- Flags: Indicate query/response status, recursion, etc.
- Questions: The queried domain
- Answers: Resolved IP addresses
- Authority and Additional sections

Locating DNS Traffic

In Wireshark:

- Use the filter `dns` to display all DNS packets.
- Filter by specific domains: `dns.qry.name == "example.com"`.
- Filter by response code (rcode): `dns.flags.rcode != 0` for errors.

Deciphering DNS Queries and Responses

- DNS Query Packets: Show the domain name being queried.
- DNS Response Packets: Show the IP address(es) returned, along with TTL and other info.

Practical Steps for DNS Troubleshooting

Identifying Failed DNS Resolutions

- Look for DNS response packets with non-zero rcode values.
- Common error codes include:
 - **NXDOMAIN (3)**: Domain does not exist.
