Automatic Washroom Light Project Report

The advent of automation technology has transformed everyday environments, making them more efficient, hygienic, and user-friendly. Among these innovations, the automatic washroom light system stands out as a practical application that enhances energy conservation and user convenience. This project report delves into the design, implementation, and benefits of an automatic washroom lighting system, offering insights into how modern electronics and sensor

technology can optimize one of the most frequently used spaces in any facility.

Introduction

The automatic washroom light project report explores a system designed to automatically turn on and off lighting fixtures within a washroom based on occupancy detection. Traditional washroom lighting relies on manual switches, which can lead to unnecessary energy wastage when lights are left on or inconvenience caused when users forget to switch off the lights. The automation solution addresses these issues by deploying sensors and microcontrollers to detect presence and control lighting accordingly. This not only improves energy efficiency but also enhances hygiene by reducing physical contact with switches.

Objectives of the Project

The primary goals of the automatic washroom light system are:

- Energy Conservation: Reduce unnecessary power consumption by switching lights off when the washroom is unoccupied.
- User Convenience: Provide a seamless lighting experience without manual intervention.
- Hygiene Improvement: Minimize contact points, thereby reducing germ spread.
- Automation and Reliability: Ensure consistent operation with minimal maintenance.

System Components and Architecture

Understanding the core components and their roles is essential to grasp how the system functions. The main components include sensors, microcontrollers, relays, power supplies, and control circuitry.

- Sensors

Infrared (IR) Motion Sensors are the backbone of the detection mechanism. They sense the presence of a person by detecting infrared radiation emitted from the body. When someone enters the washroom, the sensor detects motion or heat signature and signals the control unit.

Additional Sensors (Optional):

- Ultrasonic Sensors for more precise detection.
- Light Sensors to adjust lighting based on ambient light levels.

- Microcontroller

A compact and programmable device, such as an Arduino or Raspberry Pi, acts as the brain of the system. It processes signals from sensors and sends commands to switch the lights on or off accordingly.

- Relay Module

Relays function as electrically operated switches that control the high-voltage lighting circuits based on signals from the microcontroller. They allow safe isolation between the low-voltage control circuit and the high-voltage lighting system.

- Power Supply

A stable power source (typically 12V or 5V DC supply for microcontrollers and sensors) ensures reliable operation. Proper voltage regulation and filtering are vital for system stability.

- Control Circuitry

This includes wiring, resistors, and other electronic components that facilitate communication among system parts.

Working Principle

The system operates on a simple yet effective logic:

- Detection Phase: When a person enters the washroom, the IR sensor detects motion or heat signature.
- Signal Processing: The sensor sends a signal to the microcontroller indicating occupancy.
- Lighting Activation: Upon receiving the signal, the microcontroller activates the relay, which closes the circuit and turns on the light.
- Continuous Monitoring: The system continuously monitors sensor input. If no motion is detected for a predefined timeout period (e.g., 2 minutes), the microcontroller deactivates the relay, turning off the light.
- Re-activation: When another person enters, the cycle repeats.

This automation ensures that lights are only ON when needed, conserving energy and reducing

manual effort.

Design and Implementation

The design process involves selecting suitable components, creating circuit diagrams, programming the microcontroller, and testing the system.

Step 1: Component Selection

- Sensor: PIR (Passive Infrared) motion sensor with a detection range suitable for washroom dimensions.
- Controller: Arduino Uno or equivalent microcontroller.
- Relay Module: 5V relay compatible with Arduino.
- Power Supply: 12V DC adapter with voltage regulators for microcontroller and sensor.
- Lighting: LED-based fixtures for energy efficiency.

Step 2: Circuit Diagram

A typical circuit includes connecting the PIR sensor's output pin to a digital input pin of the Arduino, the relay coil to a digital output pin through a transistor (if required), and the relay contacts in series with the washroom lighting circuit.

Step 3: Programming

The microcontroller is programmed to:

- Detect motion signals.
- Control relay activation.
- Implement a delay timer to turn off lights after a period of inactivity.

Sample pseudo-code:

```
...
```

```
if (motion_detected) {
```

```
    turn_on_light();
```

```
    reset_timer();
```

```
}  
  
if (timer_expires) {  
  
    turn_off_light();  
  
}  
  
...
```

Step 4: Assembly and Testing

Once assembled, the system is tested in a controlled environment to ensure proper detection, switching, and fail-safes. Adjustments are made for sensor sensitivity and timeout durations.

Benefits and Advantages

Implementing an automatic washroom lighting system offers several benefits:

- Energy Savings: Significant reduction in energy consumption over manual systems.
