Properties of Fluids

Understanding fluid behavior begins with its physical properties:

- Density (ρ): Mass per unit volume (kg/m^3). It influences buoyancy, pressure, and flow characteristics.
- Viscosity (μ): Measure of a fluid's internal resistance to flow ($\text{Pa}\cdot\text{s}$). Higher viscosity implies a more viscous fluid.
- Pressure (P): Force exerted per unit area (Pa). It acts perpendicular to the surface within the fluid.
- Velocity (V): The speed of fluid particles at a point (m/s).
- Surface Tension: The force at the fluid's surface due to cohesive forces, significant in small-scale phenomena.
- Compressibility: Tendency of a fluid to change volume under pressure. Liquids are generally incompressible, gases are compressible.

Basic Principles and Laws

- Pascal's Law: Pressure applied to an enclosed incompressible fluid is transmitted uniformly throughout the fluid.

- Archimedes' Principle: A body submerged in a fluid experiences an upward buoyant force equal to the weight of displaced fluid.
- Continuity Equation: For incompressible flows, the mass flow rate remains constant:

$$\rho_1 A_1 V_1 = \rho_2 A_2 V_2$$

$$A_1 V_1 = A_2 V_2$$

$$\rho_1 A_1 V_1 = \rho_2 A_2 V_2$$

where A is cross-sectional area and V is velocity.

- Bernoulli's Equation: Energy conservation in steady, incompressible, non-viscous flow:

$$P + \frac{1}{2} \rho V^2 + \rho g h = \text{constant}$$

$$P + \frac{1}{2} \rho V^2 + \rho g h = \text{constant}$$

$$P + \frac{1}{2} \rho V^2 + \rho g h = \text{constant}$$
