Question 3: Calculations Involving Energy

Sample Question:

Calculate the amount of heat required to raise the temperature of 100 g of water from 20°C to 100°C. (Specific heat capacity of water = 4.2 J/g°C)

Solution:

Use the formula:

$$Q = mc\Delta T$$

Where:

Q = heat energy (J)

m = mass (g) = 100 g

c = specific heat capacity = 4.2 J/g°C

ΔT = change in temperature = 100°C - 20°C = 80°C

1. Multiple Choice Questions (MCQs)

While the actual memoranda often do not provide explicit explanations for MCQs, they do supply the correct options and reasonings where applicable. For example:

- Sample Question: What is the chemical formula of water?
- Answer: H_2O
- Explanation: The memoranda confirms the correct answer and may briefly explain the composition of water molecules.

Expert Tip: Use the answer keys as a quick reference, but always understand the underlying principles, such as molecular composition and bonding, to excel in similar questions.

2. Short Answer Questions

These often involve conceptual explanations or straightforward calculations. The memorandum provides:

- Precise answers
- Supporting explanations where necessary
- Relevant formulae and their applications

Example: Define conservation of energy.

Memorandum: Conservation of energy states that energy cannot be created or destroyed but only transformed from one form to another. The memorandum may include an example, such as potential energy converting into kinetic energy.

3. Calculation-Based Questions

These are often the most challenging parts of the exam, requiring detailed step-by-step solutions. The memorandum offers:

- Full derivations
- Correct application of formulae
- Final answers with appropriate units
- Marks allocated for each step

Example: Calculate the velocity of an object dropped from a height of 80 meters, neglecting air resistance.

Solution Provided:

Using $(v = \sqrt{2gh})$ where $g = 9.8 \text{ m/s}^2$

$(v = \sqrt{2 \times 9.8 \times 80})$

$(v = \sqrt{1568} \approx 39.6, \text{ m/s})$
