Foundations of Time Series Theory

Understanding Time Series Data

Time series data consist of observations recorded sequentially over time, often at uniform intervals. Typical features include:

- Trends: Long-term upward or downward movements.
- Seasonality: Regular, periodic fluctuations.
- Cyclicity: Irregular oscillations not necessarily of fixed period.
- Irregular or Random Components: Noise or unpredictable variations.

Analyzing such data requires models capable of capturing these features accurately to understand the underlying processes and make predictions.

Stationarity and Its Importance

A fundamental concept in time series analysis is stationarity, which implies that statistical properties such as mean, variance, and autocovariance do not change over time. Brockwell and Davis emphasize the importance of stationarity because many models assume it for simplicity and mathematical tractability. Non-stationary data often require transformation (like differencing) to achieve stationarity before modeling.

Core Models in Brockwell Davis Time Series Theory

Autoregressive (AR) Models

AR models express a current value as a linear combination of previous values plus a stochastic error term:

- AR(p): where p denotes the order of the model.
- Mathematical form:
$$X_t = \phi_1 X_{t-1} + \phi_2 X_{t-2} + \dots + \phi_p X_{t-p} + \varepsilon_t$$
- Usefulness: modeling processes with dependence on recent past values.

Moving Average (MA) Models

MA models relate the current value to past error terms:

- MA(q): where q is the order.
- Mathematical form:
$$X_t = \varepsilon_t + \theta_1 \varepsilon_{t-1} + \dots + \theta_q \varepsilon_{t-q}$$
- Usefulness: capturing short-term shocks or noise.

Autoregressive Moving Average (ARMA) Models

ARMA models combine AR and MA components:

- Suitable for stationary time series.
- Mathematical form:
$$X_t = \phi_1 X_{t-1} + \dots + \phi_p X_{t-p} + \varepsilon_t + \theta_1 \varepsilon_{t-1} + \dots + \theta_q \varepsilon_{t-q}$$
- Significance: flexible modeling of complex autocorrelation structures.

Autoregressive Integrated Moving Average (ARIMA) Models

ARIMA models extend ARMA to non-stationary data through differencing:

- Incorporates an integration component (I) for differencing.
- Mathematical form: $ARIMA(p, d, q)$, where d indicates the degree of differencing.
- Application: modeling and forecasting non-stationary time series.

Fundamental Concepts in Brockwell Davis Time Series Analysis

- Stationarity and Ergodicity

A cornerstone of the theory is the assumption or analysis of stationarity where the statistical properties of the process do not change over time. Stationary processes have constant mean, variance, and autocovariance structure, which simplifies modeling and inference.

Ergodicity ensures that time averages converge to ensemble averages, allowing us to infer properties from a single observed realization of the process.

These functions measure the dependence of the process at different lags:

- Autocovariance function $\gamma(h)$: Covariance between observations separated by lag h .
- Autocorrelation function $\rho(h)$: Normalized autocovariance, bounded between -1 and 1.

The decay pattern of these functions informs the choice of models (e.g., AR, MA processes).
