- A) Propofol
- B) Succinylcholine
- C) Isoflurane
- D) Midazolam

Answer: C) Isoflurane

Explanation:

Malignant hyperthermia is a pharmacogenetic disorder triggered by certain anesthetic agents. Inhalational agents like isoflurane, sevoflurane, desflurane, and the depolarizing muscle relaxant succinylcholine are known triggers. Among these, volatile anesthetics like isoflurane are most commonly implicated.

Question 2:

Which parameter is most reliable for monitoring the depth of anesthesia?

- A) Heart rate
- B) End-tidal CO₂
- C) Bispectral Index (BIS)
- D) Blood pressure

Answer: C) Bispectral Index (BIS)

Explanation:

BIS monitoring provides a quantitative measure of the patient's level of consciousness and anesthesia depth by analyzing EEG signals. It is considered more reliable than traditional vital signs in assessing anesthesia depth.

Question 3:

In a patient with a history of difficult airway, which airway management technique is considered the gold standard?

- A) Mask ventilation
- B) Laryngeal mask airway (LMA)
- C) Direct laryngoscopy with endotracheal intubation
