Sample Objective Questions and Their Detailed Explanations

Question 1:

What is the time complexity of binary search in a sorted array?

a) O(n)

b) O(log n)

c) O(n log n)

d) O(1)

Answer: b) O(log n)

Explanation:

Binary search works by repeatedly dividing the search interval in half. Starting with the entire array, it compares the target value with the middle element, then discards half of the array based on the comparison. This halving process continues until the element is found or the interval becomes empty. Because each comparison reduces the problem size by a factor of two, the total number of

comparisons is proportional to the logarithm of the number of elements, making the time complexity O(log n).

Question 2:

Which of the following algorithms has the best average-case time complexity for sorting?

a) Bubble Sort

b) Insertion Sort

c) Merge Sort

d) Quick Sort

Answer: d) Quick Sort

Explanation:

While Merge Sort guarantees O(n log n) time complexity in all cases, Quick Sort generally performs better on average due to lower constant factors and cache efficiency. Its average-case time complexity is O(n log n). However, it can degrade to O(n^2) in the worst case if poor pivot choices are made. In practice, with good pivot selection, Quick Sort is often faster than Merge Sort, making it the best average-case performer among the options.

Question 3:

The recurrence relation T(n) = 2T(n/2) + n models the time complexity of which algorithm?

a) Merge Sort

b) Binary Search

c) Quick Sort (best case)

d) Selection Sort

Answer: a) Merge Sort

Explanation:

Merge Sort divides the array into two halves (hence T(n/2) twice), sorts each recursively, and then merges the sorted halves, which takes linear time O(n). The recurrence T(n) = 2T(n/2) + n captures this divide-and-conquer process. Solving this recurrence via the Master Theorem yields a time complexity of O(n log n).

Question 4:

Which data structure is most suitable for implementing a priority queue?

a) Array

b) Stack

c) Heap

d) Queue

Answer: c) Heap

Explanation:

A heap, specifically a binary heap, provides efficient insertion and extraction of the minimum or maximum element, both in O(log n) time. This makes it ideal for implementing priority queues, where elements are processed based on priority rather than order of insertion.

Question 5:

In the context of algorithm complexity, Big O notation describes:

a) The minimum time an algorithm takes

b) The maximum time an algorithm takes for any input size

c) The average time an algorithm takes

d) The exact running time of an algorithm

Answer: b) The maximum time an algorithm takes for any input size

Explanation:

Big O notation provides an upper bound on the growth rate of an algorithm?s running time or space requirement as a function of input size. It describes the worst-case scenario, helping developers understand the maximum resources an algorithm might consume.

Tips for Success in Algorithm and Complexity Objective Questions
