

Image fusion using wavelet transform matlab code Ebook

image fusion using wavelet transform matlab code has become an essential technique in image processing, especially for applications such as medical imaging, remote sensing, and surveillance. Combining multiple images to produce a single, more informative image allows for better analysis and decision-making. Wavelet transform-based image fusion leverages the ability of wavelets to analyze images at different scales and resolutions, making it highly effective in preserving both the spatial and frequency information of source images. This article provides a comprehensive overview of how to implement image fusion using wavelet transform in MATLAB, including step-by-step code examples, underlying principles, and practical considerations.

Understanding Image Fusion and Wavelet Transform

What is Image Fusion?

Image fusion is the process of integrating multiple images of the same scene into a single image that contains more useful information than any individual source image. The goal is to combine the salient features of each image, such as textures, edges, or specific spectral information, to enhance the overall image quality for analysis or visualization.

Why Use Wavelet Transform for Image Fusion?

Wavelet transform provides a multi-resolution analysis of images, decomposing them into different frequency components at various scales. This property makes wavelets particularly suitable for image fusion because:

- It captures both spatial and frequency information effectively.
- It enables selective fusion of high-frequency details (edges, textures) and low-frequency components (smooth regions).
- It reduces artifacts and preserves important features during fusion.

Implementing Image Fusion Using Wavelet Transform in MATLAB

Prerequisites

Before diving into the code, ensure you have:

- MATLAB installed with the Wavelet Toolbox.
- Source images to fuse, preferably of the same size and alignment.

Step-by-Step MATLAB Code for Wavelet-Based Image Fusion

1. Load the Source Images

```
```matlab

% Read two source images

img1 = imread('image1.png');

img2 = imread('image2.png');

% Convert to grayscale if they are RGB

if size(img1,3) == 3

img1 = rgb2gray(img1);

end

if size(img2,3) == 3

img2 = rgb2gray(img2);

end

% Ensure images are of the same size

assert(isequal(size(img1), size(img2)), 'Images must be of the same size');

```
```

2. Perform Wavelet Decomposition

```
```matlab

% Choose wavelet type and decomposition level
```

```
waveletType = 'sym4'; % Symlet wavelet

decompositionLevel = 2;

% Decompose both images

[LL1, LH1, HL1, HH1] = dwt2(img1, waveletType);

[LL2, LH2, HL2, HH2] = dwt2(img2, waveletType);

...
```

### 3. Fuse the Wavelet Coefficients

There are various fusion rules; one common approach is to take the maximum absolute value from the detail coefficients and average or select the low-frequency component.

```
```matlab

% Fuse low-frequency coefficients by averaging

LL_fused = (LL1 + LL2) / 2;

% Fuse detail coefficients by selecting the maximum absolute value

LH_fused = max(abs(LH1), abs(LH2)) . sign(LH1 + LH2);

HL_fused = max(abs(HL1), abs(HL2)) . sign(HL1 + HL2);

HH_fused = max(abs(HH1), abs(HH2)) . sign(HH1 + HH2);

...
```

4. Reconstruct the Fused Image

```
```matlab

% Reconstruct the fused image using inverse DWT

fusedImage = idwt2(LL_fused, LH_fused, HL_fused, HH_fused, waveletType);
```

```
% Convert to uint8 for display
```

```
fusedImage = uint8(fusedImage);
```

```
...
```

## 5. Display and Save the Result

```
```matlab
```

```
% Display images
```

```
figure;
```

```
subplot(1,3,1); imshow(img1); title('Image 1');
```

```
subplot(1,3,2); imshow(img2); title('Image 2');
```

```
subplot(1,3,3); imshow(fusedImage); title('Fused Image');
```

```
% Save the fused image
```

```
imwrite(fusedImage, 'fused_image.png');
```

```
...
```

Advanced Techniques and Optimization

Multi-Level Wavelet Decomposition

For more detailed fusion, increase the decomposition level:

```
```matlab
```

```
decompositionLevel = 3; % or higher
```

```
% Perform multi-level decomposition
```

```
[cA, cH, cV, cD] = dwt2(img, waveletType, 'Level', decompositionLevel);
```

```
...
```

This allows capturing features at various scales, improving the quality of the fused image.

## Fusion Rules and Strategies

## Understanding Image Fusion and Its Significance

Image fusion involves integrating multiple images—often captured from different sensors, viewpoints, or modalities—into a single image that retains the most relevant information. This process enhances visualization, interpretation, and subsequent analysis.

Key motivations for image fusion include:

- Combining high spatial resolution with high spectral resolution (e.g., panchromatic and multispectral images).
- Merging thermal and visible images for surveillance or medical diagnostics.
- Fusing multiple sensor outputs to improve accuracy in remote sensing.

Effective image fusion should ideally preserve salient features, maintain image fidelity, and avoid introducing artifacts.

## Wavelet Transform: The Mathematical Backbone

Wavelet transform is a mathematical technique that decomposes an image into different frequency components with localized spatial information. Unlike Fourier transforms, wavelets provide multi-resolution analysis, enabling detailed analysis at various scales.

Advantages of wavelet transform in image fusion:

- Multi-scale decomposition captures both coarse and fine details.
- Localization in both spatial and frequency domains allows precise feature extraction.
- Flexibility in choosing different wavelet bases (e.g., Haar, Daubechies, Symlets).

Wavelet decomposition process:

- The image undergoes filtering through high-pass and low-pass filters.
- The image is split into approximation and detail coefficients at various levels.
- These coefficients represent different frequency components and spatial details.

Wavelet levels determine the depth of decomposition, impacting the fusion results.

## Methodology of Wavelet-based Image Fusion

The general process for wavelet-based image fusion involves several key steps:

### 1. Image Preprocessing

- Ensuring images are registered/aligned.
- Resampling images to the same resolution.
- Normalization if necessary.

### 2. Wavelet Decomposition

- Applying discrete wavelet transform (DWT) to each image.
- Obtaining approximation and detail coefficients.

### 3. Fusion Rule Application

- Combining coefficients according to specific rules, such as:
  - Maximum selection rule: choosing the coefficient with the larger magnitude.
  - Weighted averaging: blending coefficients based on weights.
  - Principal component analysis (PCA): for multiband images.
  - Activity level measurement: selecting coefficients based on activity or contrast.

### 4. Inverse Wavelet Transform

- Reconstructing the fused image from the combined coefficients using inverse DWT (IDWT).

### 5. Post-processing

- Enhancing the fused image for visualization.
- Removing artifacts if any.

## Implementing Image Fusion Using Wavelet Transform in MATLAB

MATLAB offers a robust environment for implementing wavelet-based image fusion. The Wavelet Toolbox provides functions such as `dwt2`, `idwt2`, and `wavedec2` to facilitate this process.

## Sample MATLAB Code for Image Fusion

Below is a step-by-step MATLAB implementation illustrating the fusion process:

```
``matlab

% Read the images to be fused

img1 = imread('image1.tif'); % e.g., multispectral image

img2 = imread('image2.tif'); % e.g., panchromatic image

% Convert images to grayscale if they are RGB

if size(img1,3) == 3

img1 = rgb2gray(img1);

end

if size(img2,3) == 3

img2 = rgb2gray(img2);

end

% Resize images to the same size if necessary

[rows, cols] = size(img1);

img2 = imresize(img2, [rows, cols]);

% Convert images to double precision

img1 = double(img1);

img2 = double(img2);
```

```
% Choose wavelet type and decomposition level

waveletType = 'db2'; % Daubechies wavelet with 2 vanishing moments

decompositionLevel = 2;

% Perform 2D Discrete Wavelet Transform on both images

[LL1, LH1, HL1, HH1] = dwt2(img1, waveletType);

[LL2, LH2, HL2, HH2] = dwt2(img2, waveletType);

% Fusion rule: maximum of coefficients

fusedLL = max(LL1, LL2);

fusedLH = max(LH1, LH2);

fusedHL = max(HL1, HL2);

fusedHH = max(HH1, HH2);

% Reconstruct the fused image using inverse DWT

fusedImage = idwt2(fusedLL, fusedLH, fusedHL, fusedHH, waveletType);

% Display results

figure;

subplot(1,3,1); imshow(uint8(img1)); title('Image 1');

subplot(1,3,2); imshow(uint8(img2)); title('Image 2');

subplot(1,3,3); imshow(uint8(fusedImage)); title('Fused Image');

...
```
