Fundamental Techniques of Warm Glass

Fusing

Fusing involves heating glass sheets or pieces until they bond into a single, cohesive piece.

Steps:

- Arrange your glass elements on a kiln shelf, leaving space for expansion.
- Place the shelf in the kiln.
- Program a firing schedule: typically a slow ramp to a "soak" temperature around 1450°F (790°C), then a slow cool to allow stress relief.
- Once cooled, inspect the fused piece; additional fusing may require multiple firings.

Tips:

- Use kiln paper or molds to shape the fused glass.
- Avoid overheating, which can cause running or warping.

Slumping

Slumping transforms flat glass into three-dimensional forms over molds.

Steps:

- Place a glass sheet over a mold that matches your desired shape.
- Fire at a temperature just below the glass's softening point (~1250°F to 1300°F).
- Monitor the progress; the glass will begin to sag and conform to the mold.
- Cool the kiln gradually to prevent stress.

Tips:

- Use mold release agents if necessary.
- Test with scrap glass to determine optimal firing temperatures.

Casting

Casting involves pouring molten glass into molds to create detailed forms.

Steps:

- Prepare your mold, ensuring it is heat-resistant.
- Heat glass to a "gather" temperature (~1500°F) in a separate kiln or furnace.
- Pour or ladle the molten glass into the mold carefully.
- Allow the glass to cool slowly to prevent cracking.

Safety note: Casting involves handling molten glass, requiring specialized equipment and safety precautions.

Advanced Techniques in Kiln Forming

Cold Working and Surface Decoration

- Engraving and etching: Use diamond tools or sandblasting after firing.
- Surface painting: Apply vitreous paints or enamels before firing.
- Added elements: Incorporate metal inclusions or other materials for unique effects.

Incorporating Other Materials

- Metal inclusions: Silver, copper, or other metals can create color effects or textures.
- Mixed media: Combine glass with ceramics, wood, or textiles for mixed-media artworks.
