Common Questions and Corresponding Answers from the Answer Key

Below are some typical questions found in the Ripple Tank Gizmo activities, along with summarized insights from the answer key.

- How does changing the frequency of the wave generator affect the wavelength?

Answer: Increasing the frequency decreases the wavelength, while decreasing the frequency increases the wavelength. This inverse relationship arises from the wave speed remaining constant in the medium; since $v = f \lambda$, where v is wave speed, f is frequency, and λ is wavelength.

- What is the pattern formed when two waves interfere constructively?

Answer: Constructive interference results in a wave with a larger amplitude, creating bright or high points in the ripple pattern. The wave peaks align, reinforcing each other.

- How does the presence of an obstacle affect wave propagation?

Answer: Obstacles cause diffraction, allowing waves to bend around edges. The pattern behind the obstacle often shows a shadow region with reduced amplitude, but waves spread into the shadow area due to diffraction.

- Describe how resonance occurs in the ripple tank.

Answer: Resonance happens when the frequency of the wave generator matches the natural frequency of the medium or a boundary, leading to increased amplitude and energy buildup. The answer key emphasizes the importance of matching frequencies to observe resonance effects.

- Why do standing waves form in the ripple tank?

Answer: Standing waves are formed when incident and reflected waves interfere constructively and destructively at specific points, creating nodes (points of no motion) and antinodes (points of maximum motion). The answer key highlights the importance of boundary conditions and wave reflection in this process.
